

# Biodiversity Research at The Woodlands

The Woodlands is home to many species of plants and wildlife! Research led by Heather Kostick (Drexel University) is aiming to collect data about these species to better understand biodiversity in urban cemeteries, and how human activities in cemeteries impact biodiversity. Cemeteries are often overlooked in research for their potential as urban green space. For more information on this research see the website at the bottom of this coloring sheet which is yours to enjoy.

**For more information on the cemetery biodiversity research going on:**
